UNDERSTANDING – THE VIRUS THAT CAUSES COVID-19.

Coronaviruses, like the one that causes COVID-19, are named for the crown-like spikes on their surface, called spike proteins. These spike proteins are ideal targets for vaccines.

WHAT IS A VIRAL VECTOR VACCINE?

A viral vector vaccine uses a harmless version of a different virus, called a "vector," to deliver information to the body that helps it protect you.

HOW DOES THE VACCINE WORK? -

The vaccine teaches your body how to make copies of the spike proteins. If you are exposed to the real virus later, your body will recognize it and know how to fight it off. you sick from the virus that is used as the vector. It cannot change your DNA in any way.

hul

When your body responds to the vaccine, it can sometimes cause tiredness, headache, muscle pain, nausea, or mild fever. These are normal signs the vaccine is working.

UNDERSTANDING — THE VIRUS THAT CAUSES COVID-19.

Coronaviruses, like the one that causes COVID-19, are named for the crown-like spikes on their surface, called **spike proteins**. These **spike proteins** are ideal targets for vaccines.

WHAT IS mRNA?

Messenger RNA, or mRNA, is genetic material that tells your body how to make proteins.

WHAT IS IN THE VACCINE?

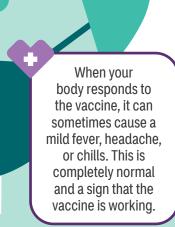

The vaccine is made of mRNA wrapped in a coating that makes delivery easy and keeps the body from damaging it.

HOW DOES THE VACCINE WORK? —

The mRNA in the vaccine teaches your cells how to make copies of the **spike protein**. If you are exposed to the real virus later, your body will recognize it and know how to fight it off.

Getting vaccinated?

For more information about COVID-19 vaccine, visit <u>cdc.gov/coronavirus/vaccines</u>

After the mRNA delivers the instructions, your cells break it down and get rid of it.
